PRINT PROCESSING SYSTEM AND METHOD WITH PRINT JOB ADVERTISING

Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in the city of Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the 10-year-old children in the school. The children were divided into two groups: the control group (10 children) and the training group (10 children). The training group participated in a 12-week training program that included aerobic, strength, and flexibility exercises. The control group did not participate in any training program. The physical fitness of the children was measured at the beginning and at the end of the 12-week period. The measurements included heart rate, blood pressure, body mass index (BMI), and physical fitness test results. The results of the study showed that the training group had significantly higher heart rate, blood pressure, BMI, and physical fitness test results compared to the control group at the end of the 12-week period. These findings suggest that a 12-week training program can improve the physical fitness of 10-year-old children.
